

Producteers develops what is probably the smallest, safest and most effective vacuum cleaner in the world

Producteers is happy to announce yet another innovative vacuum cleaner to its range. The product which is called Nano is designed to take care of “life’s little messes” on tables, floors, in cars, etc. With the size similar to a computer mouse it can be taken anywhere and as it is driven by standard batteries it requires no charging and is always ready for use.

So whether you have it in your kitchen drawer, on your office table or in your car it is always there to help you with these small spills.

In the design of the product special attention has been given to the ergonomics so it can be used easily for left and right handed users and also for children.

As the product will also be fun for children to use, and be an important learning about cleaning for them, we have made 100% sure that children no matter what can never ever get their fingers into the rotary fan which rotates at 12000 rpm.

Another very important aspect of a vacuum cleaner is the pickup and here the engineers at Producteers have focused on a good filtration level for the relevant type of debris, crumbs, etc being picked up. Also it has been important to make sure that the debris is not blown away from the cleaner but sucked in which can be a problem for small products.

Nano will be available in different colors and printing and can be made to fit any corporate branding.

Nano will be produced in Producteers factory in Shanghai with a production capacity of 10.000 units per day.

Yours sincerely

Producteers Management Team
